CRM Data Migration & Partner Import Tool

A case study from a CRM and data mapping practical assessment with an enterprise development NGO operating across seven countries

THE PROBLEM

The organisation had partner and stakeholder data scattered across spreadsheets for its Uganda programme, with plans to bring six more country offices onto a shared Monday.com CRM board. Before that rollout could happen, someone needed to migrate the existing Uganda data cleanly, catch the data quality issues hiding in it, and design a process the rest of the organisation could actually repeat.

WHAT I DID

I audited and migrated 32 partner records from the Uganda partner mapping spreadsheet into a new Monday.com CRM board, reading every record closely rather than doing a bulk import. Along the way I identified 15 concrete data quality issues, contradictory fields, an address that had been typed into a partner name field, a description sitting in the wrong column, and three spelling errors baked into the source template itself, and documented each one with a recommended fix.

I then designed and added six new fields to the CRM board (Partner Website, Contact Name, Contact Email, Contact Phone, Country, and Tags) so the board could support geographic and thematic reporting once the remaining six countries joined it. I wrote up a ten-phase methodology for the full multi-country data transition, and a report covering every data quality issue found.

Rather than stop at the spreadsheet work, I built a small web tool that validates and imports partner records directly into the CRM through the Monday.com API, so future country rollouts would not need the same manual, record-by-record entry I had just done by hand.

THE OUTCOME

32	15	6	1
partner records audited and migrated	data quality issues found and documented	new CRM fields designed and added	working import tool built and deployed

The methodology and the audit report became the reference point the organisation could hand to the remaining six country offices when their turn to migrate came. The import tool means that next migration will not require the same manual, record-by-record work this one did.

TOOLS USED

Next.js · TypeScript · React · Monday.com API · Supabase · Vercel · Excel
